

# Global Election Database explore

*Christopher Junk*

*February 15, 2019*

The ged\_subnational dataframe that has been filtered by the subnational elections. The dataframe initially has only lower house subnational elections. So, there are only subnational lower elections in this dataframe.

For subnational elections the GED data only has the following countries. The number in the cells indicates the number of parties running in that year.

```
country_year <- ged_subnational %>%  
  group_by(cnty, year)  
table(country_year$year, country_year$cnty)
```

```
